

Saint Vincent and the Grenadines Country Insights

21 Feb 2025

Congratulations! This country has available data.

This page includes country-specific insights and more detailed analysis, including carbon stocks, emissions factors, and ecosystem wetland area for mangrove, marsh, and seagrass ecosystems. This report details information for the selected country, **Saint Vincent and the Grenadines**.

Please explore the rest of the dashboard for more exciting visualizations, map features, and data.

Resources referenced to calculate estimates for **Saint Vincent and the Grenadines** are listed below under ‘References’ at the bottom of this document.

Total Carbon Stock Estimates

Total Carbon stock estimates were calculated for each country and habitat. At this time, total Carbon stock estimates do not include seagrass.

We estimate that **Saint Vincent and the Grenadines** contains between 20945.23 to 14981.82 metric tonnes of soil C to a depth of 1 m, with a mean estimate of 17963.52 metric tonnes C.

country	territory	habitat	total_stocks_lower	total_stocks_upper	total_stocks_mean	total_stocks_se
Saint Vincent and the Grenadines	Saint Vincent and the Grenadines	total	17963.52	20945.23	14981.82	1521.278

This total estimate includes total mangrove carbon stocks, from NA to NA metric tonnes of soil C to a depth of 1 m, with a mean estimate of 17963.52.

country	territory	habitat	total_stocks_lower	total_stocks_upper	total_stocks_mean	total_stocks_se
Saint Vincent and the Grenadines	Saint Vincent and the Grenadines	mangrove	17963.52	NA	NA	1552.971

This total estimate also includes total tidal marsh carbon stocks, ranging from NA to NA metric tonnes of soil C to a depth of 1 m, with a mean estimate of 0.

country	territory	habitat	total_stocks_lower	total_stocks_upper	total_stocks_mean	total_stocks_se
Saint Vincent and the Grenadines	Saint Vincent and the Grenadines	marsh	0	NA	NA	NA

Seagrass carbon stocks were not included in the total value due to lack of a global, transparent, and independently assessed seagrass habitat map; however, best available areas and stocks for **Saint Vincent and the Grenadines** are explored in the following ‘Wetland Areas and Activities’ section.

Wetland Areas and Activities

We estimate mangrove area in **Saint Vincent and the Grenadines** to be 40.8629926900295 to 0 hectares, with a mean estimate of 46.5376290073529 hectares according to Global Mangrove Watch Bunting et al. (2018).

We estimate tidal marsh area in **Saint Vincent and the Grenadines** to be 0 to 0 hectares, with a mean estimate of hectares according to Worthington et al. (2024).

We estimate seagrass area to be **Saint Vincent and the Grenadines** to be a mean of 320 hectares, according to McKenzie et al. (2020), aggregating data from multiple sources.

McKenzie et al. (2020) classifies seagrass area estimates as either high or medium to low confidence. `seagrass_area_high_confidence` % of the estimated seagrass area of **Saint Vincent and the Grenadines** is considered high to medium confidence, while `seagrass_area_low_confidence` % of the estimated seagrass area is categorized as low confidence.

Calculated Stocks and Emissions Factors

This section of the report details whether data is available to estimate Tier I, Tier II, or Tier III value estimates for tidal marsh, mangrove, and seagrass ecosystems in **Saint Vincent and the Grenadines**.

If data for the selected country is available in the Coastal Carbon Atlas, we have applied a Tier II emission factor based on a simple average of country specific data queried from the Atlas.

Data from **Saint Vincent and the Grenadines** includes 0 soil profiles from 0 watersheds. This data comes from 0 different habitat types.

If there is not yet any country specific information in the Coastal Carbon Atlas, we instead applied IPCC Tier I estimate. IPCC Tier I estimates for mangrove, marsh, and seagrass ecosystems are listed below.

SOURCE

The table in this section also details whether the calculated Tier II value is significantly different from the estimated Tier I values. This is observed in the “Overlap” column.

Table 4: IPCC Tier I Value Estimates

Habitat	Mean	Lower_CI	Upper_CI
mangrove	386	351	424
marsh	255	254	297
seagrass	108	84	139

Table 5: Availability of Tier I and Tier II Data

Country	Territory	Habitat	Tier	Overlap
Saint Vincent and the Grenadines	Saint Vincent and the Grenadines	mangrove	Tier I	NA
Saint Vincent and the Grenadines	Saint Vincent and the Grenadines	marsh	Tier I	NA
Saint Vincent and the Grenadines	Saint Vincent and the Grenadines	seagrass	Tier I	NA

Tier I Carbon Stocks

This table includes Tier I Carbon Stocks included for **Saint Vincent and the Grenadines**.

country	territory	habitat	stock_MgHa	stock_MgHa	stock_MgHa	Carbon_pool
Saint Vincent and the Grenadines	Saint Vincent and the Grenadines	mangrove	386	351	424	TierI soil
Saint Vincent and the Grenadines	Saint Vincent and the Grenadines	marsh	255	254	297	TierI soil
Saint Vincent and the Grenadines	Saint Vincent and the Grenadines	seagrass	108	84	139	TierI soil

Tier II Carbon Stocks

This table includes Tier II Carbon Stock estimates for **Saint Vincent and the Grenadines**. Estimates in this table were derived from data queried from the Coastal Carbon Atlas. SOURCE

country	territory	habitat	tier	carbon_pool	stock_MgHa	stock_MgHa	stock_MgHa	stock_MgHa	lowerCI
---------	-----------	---------	------	-------------	------------	------------	------------	------------	---------

Tier III Carbon Stocks

Tier III carbon stocks were estimated, when available, from remote sensing data from Maxwell et al 2021 and Sanderman et al 2018. The table below details whether estimated values are available for **Saint Vincent and the Grenadines**, and any overlap with associated Tier I or Tier II values.

If there are no Tier III estimates associated with the selected country, please refer to Tier I and Tier II tables.

[1] "There are currently no Tier III remote sensing estimates for this country. Please refer to Tier
